photobooth 4u

PRINTING GUIDE · MAC

Print to your HiTi

Set up once. After that, every session prints by itself: 4×6 photos on one setting, and 2×6 strips cut in two on the other. Do the test in Part 4 before the event.

PART 1 · INSTALL THE HITI (ONCE)

1 Install the driver

Download the **macOS driver for your HiTi model** from HiTi's website, install it, then restart the Mac.

2 Connect the printer

Turn the HiTi on, load the ribbon and paper, and plug its USB cable into the Mac.

3 Add it to the Mac

System Settings → **Printers & Scanners** → **Add Printer**. Select the HiTi and check that **Use** shows the HiTi driver (not "Generic"). Name it `HiTi 4x6` → **Add**.

4 Test it

Print any photo from the **Preview** app at **6×4, borderless** to check that the printer works.

PART 2 · ADD IT AGAIN FOR 2×6 STRIPS (only if you print strips)

The booth prints two strips side by side on one 4×6 sheet, and the HiTi cuts the sheet in half.

1 Add the same HiTi a second time

Add Printer again, choose the same HiTi, name it `HiTi 2x6 cut` → **Add**. You now have two printers that are really one machine.

2 Open the printer settings page

Open **Terminal** and run `cupsctl WebInterface=yes`. Then in Chrome open **localhost:631/printers**. If it asks for a username and password, use your Mac's login.

3 Set each printer's paper

Click **HiTi 4x6** → **Administration** menu → **Set Default Options**: Media Size **6x4**, borderless if listed → save. Then **HiTi 2x6 cut** → **Set Default Options**: the **2-inch cut** paper option (named like "6x4 (2x6 ×2)" or "6x4 Split", depending on the model) → save.

Only printing 4×6? Simpler way

Skip Parts 2 and 3. Make the HiTi the Mac's **default printer**, do one normal print, then start Chrome with this command in Terminal so prints go out with no pop-up:

```
open -a "Google Chrome" --args --kiosk-printing https://photobooth4u.netlify.app/
```

PART 3 · SET UP THE BOOTH

1 Open the Print Helper

Download it from **photobooth4u.netlify.app/downloads/** (Apple Silicon or Intel), unzip, then **right-click → Open** the first time. If macOS blocks it: **System Settings → Privacy & Security → Open Anyway**.

2 Keep its window open

A Terminal window opens and lists your printers, e.g. `HiTi_4x6` and `HiTi_2x6_cut`. **Leave it open during the whole event.**

3 Turn it on in the booth

In **Photo Session**, tap 🖨 **Print settings** (bottom left) and switch on **Print Helper on this computer**. If Chrome asks to access devices on your network, click **Allow**.

4 Choose the printers

Tap **4R** and choose `HiTi_4x6` from the **Printer for…** list. Under **Printer for 4R · strip layouts (2 strips, cut)**, choose `HiTi_2x6_cut`. The booth remembers this on this Mac.

PART 4 · TEST BEFORE THE EVENT

1 Test a 4R layout

Take a session with a 4R layout → **Print**. You should get a full 4×6 with no white border.

2 Test a strip layout

Take a session with a strip layout → **Print**. You should get **two 2×6 strips, cut**.

3 Turn on Auto-print

Both right? Tick **Auto-print every session**. Every session now prints by itself to the right printer, with no pop-up.

IF SOMETHING'S WRONG

PROBLEM	FIX
"Can't reach the Print Helper"	Keep the Print Helper window open and open the booth from **photobooth4u.netlify.app**. Chrome: Site settings → **Local network access → Allow**. Brave: lion icon → **Shields off**. Then tap **Check again**.
HiTi isn't in the booth's printer list	Check that it's on and plugged in, then close and reopen the Print Helper.
Strips print but don't get cut	The cut option isn't saved as the default for **HiTi 2x6 cut**. Redo Part 2, step 3.
White border or wrong size	Fix the paper size and borderless setting in that printer's **Set Default Options** (Part 2).
Printer shows "Paused"	**System Settings → Printers & Scanners** → the HiTi → **Resume**. Check the ribbon and paper.
No cut option in the list	In Terminal run `lpoptions -p HiTi_2x6_cut -l` and send us the result. We'll reply with the one line that sets it.
